8. Commercial Pilot Plan
9. Risks And Controls
10. Immediate Next Actions

Executive Summary

The goal is to turn the current Jhonny Odoo integration into a simple, sellable retail intelligence product. The first POC should prove one strong loop: Jhonny can see live business analytics in a web app and ask business questions through an agent, while Rodrigo connects the same agent to WhatsApp.

This should remain narrow. The product is not a generic AI platform yet. It is a practical business copilot for small retailers that answers daily owner questions from live operational data: sales, stock value, low stock, category performance, purchases, and basic financial signals.

1. Product Goal

Build a first POC that Jhonny can actually use and that can be shown to other small retailers.

The first version should include:

Capability	Description	Success Criteria
Analytics app	Web app with live Odoo dashboards	Jhonny can see sales, stock, categories, and low stock
Agent chat	App chat box for natural-language questions	Owner asks a question and receives a grounded answer from Odoo data
WhatsApp agent	WhatsApp interface for the same agent	Approved phone number receives correct answers
Repeatable pilot	Simple setup path for the next retailer	New client can be onboarded without rewriting the product

2. Workstream Ownership

Owner	Primary Focus	Key Deliverables
Tiago	Web app and analytics experience	Analytics tab, agent chat page, app polish, mobile-friendly demo
Rodrigo	WhatsApp feature	WhatsApp provider setup, webhook connection, phone authorization, message formatting
Shared	Backend, tools, LLM agent, deployment	FastAPI backend, Odoo tools, Databricks LLM calls, deployment, logs

3. Target Architecture

The app and WhatsApp should share the same backend and the same agent logic. This avoids building two separate products.

4. Tiago Plan: App And Analytics

Tiago should focus on making the app simple and usable. The first app should have two modes:

Mode	Purpose	Content
Analytics	Business overview	Today sales, month sales, YTD sales, stock value, category mix, low stock
Agent Chat	Ask the business questions	Chat box, suggested prompts, answer history, tool used

Minimum app requirements:

- Demo token access.
- Analytics tab with live Odoo numbers.
- Agent chat tab with prompt buttons.
- Clear loading and error states.
- Mobile-friendly layout for a shop owner.
- No complex admin area yet.

Suggested first prompts:

- How much did we sell today?
- What is our stock value?
- What categories sold today?
- What is low stock?
- Give me key financials.

5. Rodrigo Plan: WhatsApp Channel

Rodrigo should connect WhatsApp after the backend chat endpoint is stable.

Recommended path:

Step	Decision	Notes
1	Start with Twilio sandbox or Meta WhatsApp Cloud API	Twilio is faster for demo; Meta is better for production
2	Point inbound messages to <code>/webhooks/whatsapp</code>	Backend already exposes this route
3	Restrict approved numbers	Only Jhonny and internal test phones should be allowed
4	Test core prompts	Use the same questions as the app
5	Add production controls	Signature verification, logging, rate limits

WhatsApp answers should be shorter than app answers and should avoid sensitive customer data.

6. Shared Backend And Agent Plan

The backend should be the product core. It should expose:

Endpoint	Purpose
<code>GET /health</code>	Hosting and uptime checks
<code>GET /dashboard</code>	App analytics data
<code>POST /chat</code>	App agent chat
<code>POST /tools/{tool_name}</code>	Internal testing for business tools
<code>POST /webhooks/whatsapp</code>	WhatsApp inbound messages

The LLM agent should not query raw Odoo freely. It should choose from curated tools:

Tool	Purpose
<code>get_today_sales</code>	Current day sales and order count
<code>get_month_sales</code>	Month-to-date sales
<code>get_sales_by_category</code>	Sales grouped by category
<code>get_stock_value</code>	Inventory value and units
<code>get_stock_value_by_category</code>	Stock value concentration
<code>get_low_stock</code>	Products needing review
<code>get_key_financials</code>	YTD sales, stock, purchases, receivables, payables

7. Roadmap And Milestones

Phase	Timeline	Goal	Owner
Phase 1	Now	Working app with analytics and agent chat	Tiago
Phase 2	Next	WhatsApp connected to same agent	Rodrigo
Phase 3	Next	Databricks LLM credentials configured and tested	Shared
Phase 4	Next	Hosted demo with secure secrets and basic logs	Shared
Phase 5	After Jhonny demo	Paid pilot outreach to similar retailers	Founding team

The most important milestone is a stable demo where the owner asks a question and the answer comes from live Odoo data.

8. Commercial Pilot Plan

The first paid offer should be simple:

Item	Recommendation
Setup fee	EUR 1,500 to EUR 3,000
Monthly pilot fee	EUR 300 to EUR 900
Anchor offer	EUR 2,000 setup plus EUR 500 per month
Pilot duration	2 to 4 weeks
Target clients	Small retailers with 1 to 10 stores

Do not sell it as "AI". Sell it as fast daily business answers from systems the retailer already uses.

9. Risks And Controls

Risk	Impact	Control
Numbers do not match Odoo UI	Loss of trust	Validate key metrics manually with Jhonny
WhatsApp exposes sensitive data	Security risk	Restrict phone numbers and avoid customer personal data
Team builds too much before selling	Slow revenue	Keep the first version narrow
LLM gives unsupported answers	Trust risk	Force answers through curated tools
Credentials are exposed	Security risk	Rotate Odoo key and use managed secrets before deployment

10. Immediate Next Actions

Priority	Action	Owner
1	Polish the two-tab app for Jhonny: Analytics and Agent Chat	Tiago
2	Configure Databricks Model Serving credentials	Shared
3	Connect WhatsApp provider to <code>/webhooks/whatsapp</code>	Rodrigo
4	Deploy backend and frontend to a public demo URL	Shared
5	Run a 5-minute Jhonny demo and collect feedback	Founding team
6	Use feedback to approach 10 to 20 similar retailers	Founding team

The current priority is to make the app feel real and useful for Jhonny. Once the app and WhatsApp both work from live data, the team should start selling paid pilots immediately rather than waiting for a full SaaS platform.
